

Group Project 4: Final Submission

Description:

Our chatbot webpage now has a working database to store users and also a functioning AI chatbot. We were able to create our website from what we brainstormed in the beginning. RAGBot is an assistive AI that summarizes a given document from the user. Furthermore, users can ask questions regarding the document to get further detailed answers.

Approach / What I Did:

For the final milestone, we just needed to tweak some adjustments to our web UI to make it look more sleek and chic. We also updated our About us and FAQs and so user's will be able to know about us and also look for answers for their questions. We didn't add much to the webpage since the last milestone and so we took this opportunity to clean up and add/remove some things we felt were needed/unneeded. And that brought us to removing the contact page because it would require another database and we wouldn't have the time to implement it in this short period of time.

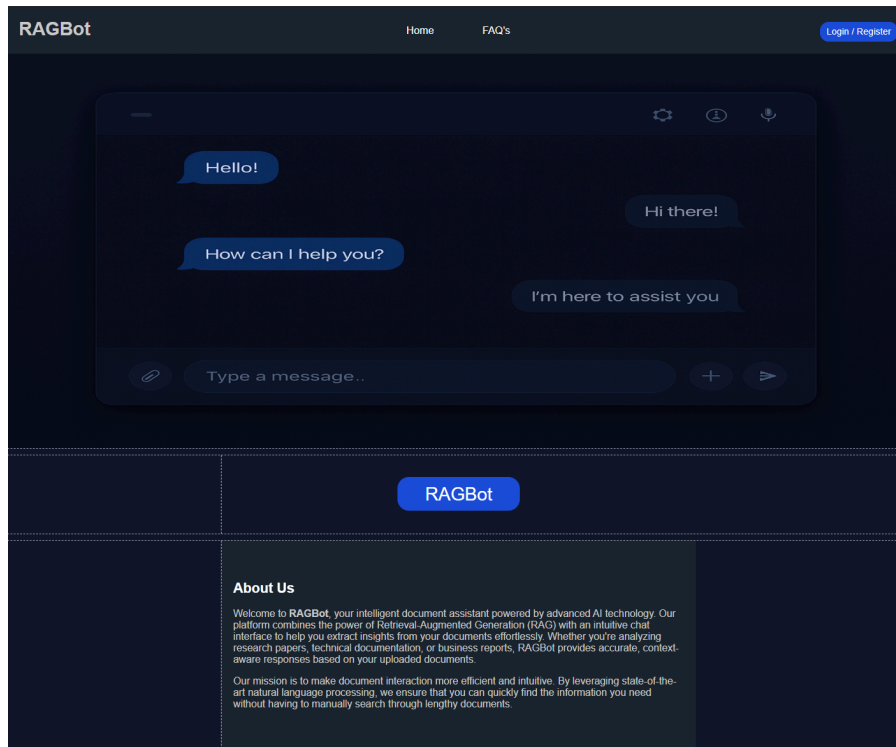

Issues and Resolutions:

Our previous milestone had issues in the login/registration and so we took the time to look for the error and fix it before the final submission. What caused the error is that we didn't put the right argument in the code file containing the database, and so when we would try to run it. It wouldn't register or login a user.

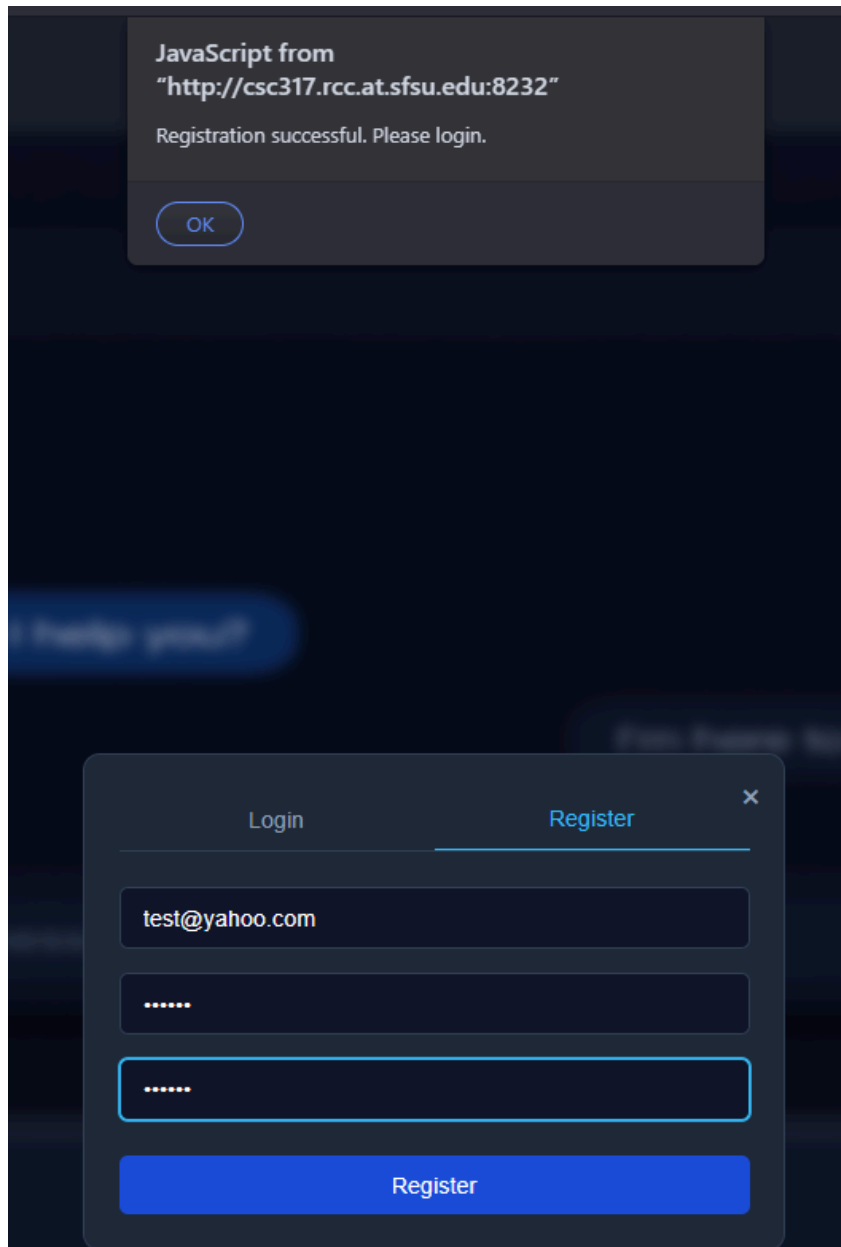

Analysis:

Everyone in the team learned so much from each other. We were able to share ideas of our own and help each other solve a problem they might have. And by doing so, we were able to gain knowledge of some things we didn't know yet. We believe that working as a group is beneficial for everyone because you get to share your knowledge to others and expand what you know.
